

**Amendments to the Claims:** This listing of claims will replace all prior versions, and listings, of claims in the application

**Listing of Claims:**

1. (Currently Amended) A method of manufacturing a catalysed ceramic wall-flow filter comprising a plurality of channels, which method comprising the steps of:
  - (a) reducing the pressure in a pore structure of the channel walls relative to the surrounding atmospheric pressure to provide evacuated channel walls,
  - (b) contacting a surface of the evacuated channel walls with a liquid containing at least one catalyst component or a precursor thereof, whereby the liquid permeates the evacuated channel walls,
  - (c) drying the filter containing the catalyst component or its precursor, and
  - (d) calcining the filter containing the catalyst component or its precursor.
2. (Previously Presented) A method according to claim 1, wherein steps (b) and (c) are repeated at least once prior to step (d).
3. (Previously Presented) A method according to claim 1, wherein the pressure reduction in the pore structure of the channel walls is maintained during the liquid contacting step.
4. (Previously Presented) A method according to claim 1, wherein the liquid contains the precursor and comprises an aqueous solution of at least one metal salt.
5. (Currently Amended) A method according to claim 1, wherein the liquid containing-the at least one catalyst component comprises a slurry of at least one particulate metal oxide material in a carrier medium.
6. (Currently Amended) A method according to claim 5, wherein-the D50-of the at least one particulate metal oxide material-is has a D50 in the range 1-20,  $\mu\text{m}$ .
7. (Previously Presented) A method according to claim 1, wherein the liquid containing the at least one catalyst component comprises a sol of at least one metal oxide material in a carrier medium.

8. (Currently Amended) A method according to claim 7, wherein the D<sub>50</sub> of the solid particles is have a D<sub>50</sub> in the range 10-500 nm.
9. (Canceled)
10. (Currently Amended) A method according to claim 1, wherein the loading of the at least one catalyst component is loaded in the catalysed ceramic wall-flow filter is in an amount from 20-120g/litre.
11. - 14. (Canceled)
15. (Currently Amended) A method according to claim 1, wherein the material from which the ceramic filter is made is from a material selected from the group consisting of silicon, silicon carbide, aluminium nitride, silicon nitride, aluminium titanate, alumina, cordierite, mullite pollucite and a thermet such as Al<sub>2</sub>O<sub>3</sub>/Fe, Al<sub>2</sub>O<sub>3</sub>/Ni or B<sub>4</sub>C/Fe.
16. (Currently Amended) A method according to claim 1, wherein the virgin filter material has a porosity of 40-60%, prior to use.
17. (Canceled)
18. (Currently Amended) Apparatus for use in manufacturing a catalysed ceramic wall-flow filter having filter walls, wherein said filter walls define a plurality of channels and have a pore structure, said apparatus comprising means for sealingly isolating a plurality of channels of the ceramic wall-flow filter from the surrounding atmosphere, means for reducing the pressure in the isolated channels to below the surrounding atmospheric pressure thereby to establish a vacuum in the pore structure of the filter walls to provide isolated and evacuated channels, at least one reservoir for holding a liquid containing at least one catalyst component or a precursor thereof and means for dosing the isolated and evacuated channels with a pre-determined quantity of the liquid.
19. (Previously Presented) Apparatus according to claim 18, wherein the means for sealingly isolating the plurality of channels comprises a pressurisable container having a sealable closure for receiving the ceramic wall-flow filter.
20. (Previously Presented) An apparatus according to claim 18, wherein the means for maintaining the reduced pressure in the isolated channels to below the surrounding

atmospheric pressure comprises means for maintaining the reduced pressure during dosing of the liquid.

21. (Previously Presented) An apparatus according to claim 18 wherein the apparatus is at least semi-automated to control both the means for reducing pressure in the isolated channels and the means for dosing the liquid.
22. (Previously Presented) A method according to claim 5, wherein the carrier medium comprises water.
23. (Previously Presented) A method according to claim 7, wherein the carrier medium comprises water.
24. (New) A method according to claim 15, wherein the material from which the ceramic filter is made is the thermet, wherein the thermet is selected from the group consisting of Al<sub>2</sub>O<sub>3</sub>/Fe, Al<sub>2</sub>O<sub>3</sub>/Ni and B<sub>4</sub>C/Fe.
